Interferon Res. 12:1-11(1992).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RECEPTOR EXPRESSION IN THE ENDOMETRIUM. THIS RESULTS IN THE SUPPRESSION OF THE DUISATILE ENDOMETRIAL RELEASE OF THE LUTEOLYTIC HORMONE PROSTAGLANDIN F2-ALPHA, HINDERING THE REGRESSION OF THE CORPUS LUTEOM (LUTEOLYSIS) AND THEREFORE A RETURN TO OVARIAN CYCLICITY. THIS, AND A POSSIBLE DIRECT EFFECT OF IFN-TAU ON PROSTAGLANDIN SYNTHESIS, LEADS IN TURN TO CONTINUED OVARIAN PROGESTERONE SECRETION, WICH STLMULATES THE SECRETION BY THE ENDOMETRIUM OF THE NUTRIENTS REQUIRED FOR THE GROWTH OF THE CONCEPTUS. IN SUMMARY, DISPLAYS PARTICULARLY HIGH ANTIVIRAL AND ANTIPROLIFERATIVE POTENCY CONCURRENTLY WITH PARTICULAR WEAK CYTOTOXICITY, HIGH ANTILUTEOLYTIC ACTIVITY AND IMMUNOMOBULATORY PROPERTIES. IN CONTRAST WITH OTHER IFNS, IFN-TAU IS NOT VIRALLY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      THEY ENCODE FOR PROTEINS VERY SIMILAR IN SEQUENCE BUT WITH DIFFERENT BIOLOGICAL POTENCY AND PATTERN OF EXPRESSION. SIMILARITY: BELONGS TO THE INTERFERON ALPHA, BETA AND DELT.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A method has been developed of initiating or enhancing: (i) an antigen-
Consequence in the project of the mucosal administration of a polypeptide, before, after or with the mucosal administration of an immunotolerising amount of the antigen or therapeutic molecule, respectively. The polypeptide is capable of binding the filt3 receptor and is: a) amino acids 28 x of murine fit3 clipand (fit3-L), where x is an amino acid between 163-231; b) amino acids 28 y of human fit3-L, where y is an amino acid between 160-235; and c) a polypeptide that has at least 90% identity to the polypeptides of either (a) or (b). The method ameliorates the effects of autoimmune diseases, food allergies or organ or tissue rejection following transplantation. Administration of fit3-L allows lower doses of antigens to be used in vivo for mucosally administered antigens. The present of sequence represents murine fit3-L.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         compositions comprising the polynucleotides are useful for suppressing tumour growth in a mammal. The tumour is melanoma, glioma or lymphoma, particularly B-cell lymphoma. They can also be used for the prophylactic and/or therapeutic treatment of:
(a) bacterial (e.g. Bacillus infections), viral (e.g. hepatitis E and C in humans), parasitic (e.g. malaria) and fungal infections;
(b) autolumune diseases (e.g. rheumatoid arthritis and osteoarthritis); (c) cancer; and (d) Aujeszky's disease in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polynucleotide may encode the present full-length murine Flt-3 ligand polypeptide, or amino acids 28-163, 1-163, 28-189 or 1-189 of the Flt-3 ligand. The polynucleotides are incorporated into the cells of the vertebrate in vivo, and a prophylactically or therapeutically effective amount of Flt-3 ligand and 1 or more antigens or cytokines is produced in vivo. This fragment encompasses the coding region conserved between two mouse clones, T118 and T110. Approx. 20 positive clones were selected and partially sequenced. Two clones, S86 and S109, were found to be approx. 75% homologous to the mouse clones over the first 163 AAs. Clone S86 continued to show homology to T110 until the stop codon, although to a lesser degree, for an overall homology of 65%. Clones T118 and clone of the character of the codon of the codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (INRM )
                                                                                                                                                                                                                                                                                                     $109 do not show homology to each other or to the other clones after mouse residue 163 (human residue 160). An additiona mouse clone designated MBB has a 29 AA insert at the junction between the common and divergent portions of the mouse ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 11; page 79-80;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New ligand for the Flt3 tyrosine kinase receptor - and related nucleic acid, vectors, host cells and antibodies, useful for treating abnormal cell physiology and proliferation, e.g. cancer, also for diagnosis and drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Birnbaum D,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      19-MAY-1993;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1;
```

used in construction of a chimeric polypeptide comprising: (a) a first polypeptide domain containing a carboxy terminal fragment of a heat shoc protein (HSP), an Fit-3 ligand (FL), a cytoplasmic translocation domain of a Pseudomonas exotoxin A (ETA dII), or a granulocyte-macrophage color stimulating factor (GM-CSF); and (b) a second polypeptide domain containing an antigenic polypeptide. A composition comprising the chimeric polypeptide is useful for inducing an immune response such as a

a heat shock

colony

inducing

such

The sequence represents the amino acid sequence of Flt-3 ligand (FL)

These are thus useful for vaccinating a mammal against infection by inducing an immune response to a pathogen. Preferably they are useful for vaccinating a mammal against a tumour antigen. The compositions and methods are useful for stimulating or enhancing the immunogenicity of a selected antigen or stimulating or enhancing a cellular immune response specific for that antigen. The chimeric nucleic acid molecules and vaccination methods, yield potent antigen-specific immunotherapy. The polynucleotides and DNA vaccines can induce a cellular immune response that is at least 40 fold more potent than conventional DNA vaccines. The vaccines are safe and useful for administration to domesticated or agricultural animals, as well as humans, and have low immunogenicity.
                                                                                                                                                                                                                                                                                                                                                     Flt-3 ligand; Fms-like tyrosine kinase; mouse; vaccine;
immunotherapy; therapy; tumour; cancer; melanoma; glion
lymphoma; autoimmune disease; infection; gene therapy.

The present sequence is that of a secreted form of mouse Fms-like CC tyrosine kinase (Flt-3 ligand), lacking the transmembrane and cytoplasmic domains of the full-length form (see AAB20186). This secreted form of the Flt-3 ligand is expressed by vector VR6200 (see AAB201313). The invention is directed to enhancing the immune response of a vertebrate to an antigen or a cytokine by administering in vivo, into a tissue of a vertebrate, a Flt-3 ligand-encoding polynucleotide, such as VR6200, and I or more antigen- or cytokine-encoding polynucleotides. The polynucleotides are incorporated into the cells of the vertebrate in vivo, and a prophylactically or therapeutically effective amount of Flt-3 (ligand and 1 or more antigens or cytokines is produced in vivo. Pharmaceutical compositions comprising the polynucleotides are ligand and 1 or more antigens or cytokines is produced in vivo. Pharmaceutical compositions comprising the polynucleotides are useful for suppressing tunour growth in a mammal. The tunour is melanoma, glioma or lymphoma, particularly B-cell lymphoma. The co-injection of VR6200 and tumour-specific antigen-encoding plasmid conjugation of the prophylactic and/or therapeutic treatment of: challenge. The claimed pharmaceutical compositions can also be used for the prophylactic and/or therapeutic treatment of: (a) bacterial (e.g. Bacillus infections), viral (e.g. hepatitis B can dc in humans), parasitic (e.g. malaria) and fungal infections; (c) cancer; and (d) Auleszky's disease in pigs. CC Various other examples of these diseases are given in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Immunogenic compositions comprising Flt-3 ligand encoding polymuclectide and one or more antigen, or cytokine encoding polymuclectides, useful for suppressing tumour growth and for treating autoimmune diseases (e.g. rheumatoid arthritis) -

cc immune response of a vertebrate to an antigen or a cytokine by cc administering in vivo, into a tissue of a vertebrate, a Fit-3 crytokine-encoding polynucleotide, and 1 or more antigen- or cytokine-encoding polynucleotides. The Fit-3 ligand-encoding cytokine-encoding polynucleotides are incorporated into polynucleotide. The polynucleotides are incorporated into cytokine-encoding polynucleotides are incorporated into cytokines in polynucleotides are incorporated into cytokines in polynucleotides are incorporated into cytokines is produced in vivo. Pharmaceutical compositions comprising the polynucleotides are useful for suppressing tumour growth in a mammal. The tumour is melanoma, cytokines is produced in vivo. Pharmaceutical cylioma or lymphoma, particularly B-cell lymphoma. They can also be used for the prophylactic and/or therapeutic treatment of: C(a) bacterial (e.g. Bacillus infections), viral (e.g. hepatitis B cand C in humans), parasitic (e.g. malaria) and fungal infections; C(b) autolumune diseases (e.g. rheumatoid arthritis and content of content con

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                В
immune response of a vertebrate to an antigen or a cytokine by calministering in vivo, into a tissue of a vertebrate, a Fit-3 calministering in vivo, into a tissue of a vertebrate, a Fit-3 calministering polynucleotide, and I or more antigen or cytokine-encoding polynucleotides. The Fit-3 ligand-encoding cytokine-encoding polynucleotides. The Fit-3 ligand-encoding polynucleotides are incorporated into the vertebrate in vivo, and a prophylactically or the cells of the vertebrate in vivo, and a prophylactically or compositions comprising the polynucleotides are useful for compositions comprisition that in a mammal. The tumour is melanoma, comprising the polynucleotides are useful for compositions comprisition that is melanoma, comprising the polynucleotides are useful for compositions and for the tumour is melanoma, compositions compositions and for the tumour is melanoma, compositions compositions and for the tumour is melanoma, compositions and for tumour is melanoma, compositions and for tumour is melanoma.
                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of mouse Fms-like tyrosine kinase (Flt-3 ligand). The invention is directed to enhancing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunogenic compositions comprising Flt-3 ligand encoding polynuclectide and one or more antigen, or cytokine encoding polynuclectides, useful for suppressing tumour growth and for autoimmune diseases (e.g. rheumatoid arthritis).
                                                                                                                                                                                                                                                                                                                                                                                                                       Claim

Sequences AAY58204 and AAY58206-Y58209 resepctively represent encoded, mature, clone 1 and clone 19 canine Fit-3 ligand, while sequences AAY5820-Y58211 represent encoded and mature feline Fit-3 ligand. The invention relates to canine interleukin-4 (IL-4), canine or feline Fit-3 ligand, canine or feline CD40, canine or feline CD54 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony stimulating factor (GMCSF), and nuclecides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers an as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection, and in drug targetting.

Two clones, $86 and $109, were found to be approx. 75% homologous to the mouse clones over the first 163 AAs. Clone $86 continued to show homology to 7110 until the stop codon, although to a lesser degree, for an overall homology of 66%. Clones T118 and $109 do not show homology to each other or to the other clones after mouse residue 163 (human residue 160). An additiona mouse clone designated MBB has a 29 AA insert at the junction between the common and divergent portions of the mouse ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   pME188, was screened with an 800 bp fragment derived from mouse clone T118. This fragment encompasses the coding region conserved between two mouse clones, T118 and T110. Approx. 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 11; Page 76-77; 90pp; English.

The F1t-3 ligand-encoding polynucleotides. The F1t-3 ligand-encoding polynucleotides are fitted from the polynucleotide may encode the present full-length human F1t-3 ligand polypeptide, or amino acids 27-185, 1-185, 27-235 or 1-235 or fitted fitted from the fitt-3 ligand. The polynucleotides are incorporated into the cells of the vertebrate in vivo, and a prophylactically or therapeutically effective amount of F1t-3 ligand and 1 or more antigens or cytokines is produced in vivo. Pharmaceutical compositions comprising the polynucleotides are useful for suppressing tumour growth in a mammal. The tumour is melanoma, glioma or lymphoma, particularly B-cell lymphoma. They can also be used for the prophylactic and/or therapeutic treatment of:

(a) bacterial (e.g. Bacillus infections), viral (e.g. hepatitis B and C in humans), parasitic (e.g. malaria) and tingal infections;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 200

Flt-3 stimulates progenitor and stem cells, and can be used e.g. in gene therapy protocols.

CC specific immune tolerance; or (ii) immunotolerance of a therapeutic
CC immunogenic molecule by addition of a polypeptide, before, after or with
CC immunogenic molecule by addition of an oplypeptide, before, after or with
CC the mucosal administration of an immunotolerising amount of the antigen
CC or therapeutic molecule, respectively. The polypeptide is capable of
CC ligand (flt3-L), where x is an amino acids 28-x of murine flt3
CC acids 28-y of human flt3-L, where y is an amino acid between 163-231; b) amino
CC and c) a polypeptide that has at least 90% identity to the polypeptides
CC of either (a) or (b). The method ameliorates the effects of autoimmune
CC diseases, food allergies or organ or tissue rejection following
CC transplantation. Administration of flt3-L allows lower doses of antigens
CC to be used in vivo for mucosally administered antigens. The present
